Continuation of 11. does NOT place the application in condition for allowance because: The arguments with respect to Horbal not disclosing dissimilar communication devices communicating through a common interface that operates in said communication devices are not persuasive because the arguments are based on piecemeal analysis. Horbal's micro-server can be embedded into consumer products (col. 4 lines 34-36). Eythchison discloses consumer products that communicate with each other via proxy (see figure 2). The combination of Eytchison and Horbal discloses consumer products that communicate with each other via micro-servers embedded in each device. The arguments with respect to Horbal teaching away from Eytchison because Eytchison's architecture is protocol independent and Horbal's architecture is protocol dependent are persuasive. The Examiner agrees with Applicant in the regard that modifying Eytchison with Horbal would require the micro-server to be embedded on each device in Eytchison. The problem with this combination is that there is not even a common protocol stack used by the network devices. Therefore, the obviousness rejections based only on Eytchison and Horbal are withdrawn because modifying Eytchison with Horbal would require major modifications to Eytchison.

The Examiner does not agree that the combination of Norrell, Eytchison and Horbal is improper. In Norrell's architecture each device already uses TCP/IP protocols as a dependent protocol for communications among the devices (see col. 8 lines 7-15). As indicated by the Applicant, Eytchison is concerned with communications in existing infrastructures. Therefore, modifying Norrell with Eytchison does not change Norrell's dependency on TCP/IP protocols because Eytchison does not change the manner in which the network devices operate. Eytchison does change the network architecture by introducing a proxy as a common interface. Therefore, the combination of Norrell and Eytchison disclose an architecture where a proxy is used as a common interface to allow the different devices to communicate. The problem with this architecture is that it increases the total cost of ownership because there is an extra node in the network to maintain. Horbal simplifies the architecture of the combination of Norrell and Eytchison by moving the proxy functionality to each device in the form of the micro-server, which negates the need to maintain extra network nodes. Unlike the previous combination (modifying Eytchison with Horbal), all the devices in Norrell's invention already depend on the TCP/IP protocol so there is not any need to retrofit every device with a protocol dependent stack before implementing the micro-server.
